Novel nucleic acids, used to develop products for the diagnosis and treatment of disorders involving unwanted cell proliferation, particularly cancers, especially colon cancer

Claim 15; Page 258; 469pp; English.

Another than the color cancer is soluted from the human colorectal adenocarcinoma (colon cancer) cell line SW480. The human colorectal adenocarcinoma (colon cancer) cell line SW480. The canba clones can be used to generate antisense oligonucleocides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The cDNA clones can be used for developing agents for the diagnosis and treatment of disorders; involving unwanted cell proliferation, such as neoplasia, dysplasia or hyperplasia

Sequence 238 BP; 55 A; 57 C; 69 G; 57 T; 0 other;

double-stranded DNA, which comprises one of the 7837 "GS" sequences given in T19001-T2687 and which is able to hybridise to part of human genomic DNA, which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(7) as the sole primer. Since the 3'-confined cDNA by using poly(7) as the sole primer. Since the 3'-confined cDNA hybridise with specific mRNAs. Each library is confirtucted so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS. sequences) as a means of diagnosing abnormal cell function or for

X10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in X09121-X10268. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Adrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, hereditary shaemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic or encophisms of such diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       treating, preventing or ameliozating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopolesis regulating activity, tissue growth activity, activity, activity, chemotactic/chemokinetic.activity, haemostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for

This polynucleotide comprises the lactoferrin receptor (lfr) locus of Moraxella catarrhalis (Branhamella catarrhalis) Q8. There are 3 tandem genes in locus, identified as lbpA, lbpB (alternative start codons) and orf3A, respectively encoding lactoferrin binding protein 2 (lbp2, see W89417), lactoferrin binding protein 1 (lbp1, see W89418) and open reading frame protein 3 (ORF3, see W89418 and W89419) and open reading frame protein 3 (ORF3, see W89418 train Q8 genomic DNA library and screening with catarrhalis strain Q8 genomic DNA library and screening with specific hybridisation probes. The genes and DNA sequences of the 1fr locus are useful for diagnosis, immunisation, and the generation of diagnostic and immunological reagents. Immunogenic compositions, including vaccines, based upon expressed recombinant compositions, including vaccines, based upon expressed recombinant compositions of diseases caused by Moraxella. M. catarrhalis is a causative agent of cittis media and has been associated with sinusitis, conjunctivitis and inflammatory diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; PRO; EST; expressed sequence tag; PCR primer; hybridisation; probe; blood coagulation disorder; cancer; cellular adhesion disorder; secreted protein; transmembrane protein; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
Lactoferrin receptor genes from Moraxella, especially M. catarrhalis - useful to diagnose Moraxella infection e.g. to detect otitis media due to M. catarrhalis infection and to immunise against such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. 233891 to 234338, and Y41685 to Y41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              D2H; hPEPT1; human; GI tract receptor; sucrose-isomaltase complex; intestinal peptide-associated transporter; hypertension; diabetes; osteoporosis; haemophilia; anaemia; cancer; migraine; angina pectoris;

acid sequences and related vaccines to treat or prevent H. pylori
                                                                                                                                                                                                                                                                                                                                                                                                                                           Infection may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for one of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Note: This DNA sequence is not reproduced in the specification and has been derived from the related specification, W09719098.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chronic gastritis; duodenal ulcer disease; activator; inhibitor; bacterial life cycle; vaccine; immunisation; detection; antisense; inhibition; cytoplasmic; Na+/H+ antiporter; Escherichia coli; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT
T77453/c
This sequence encodes a peptide that specifically binds to the human sucrose-isomaltase complex. The invention relates to purified proteins (I) that bind specifically to at least one of the gastro-intestinal (GI) tract receptors human intestinal associated transporter (HPTI), hPEPTI, DZH and human peptide-associated transporter (HPTI), hPEPTI, DZH and human sucrose-isomaltase complex (HSI). (I) provide active transport of therapeutic agents through human and animal GI tissue (into the blood) for in vivo delivery, particularly for treatment or prevention of hypertension, diabetes, osteoporosis, haemophilia, anaemia, cancer, migrathe, or angina pectoris. Specifically they are used to deliver insulin or leuprolide, but many other suitable therapeutic agents are disclosed, including genes or inhibitory nucleic acid, imaging agents and antigens. (I) may also provide targeting to the GI tract. Other uses of (I) ane (I) and (I) in a binding assay); and (ii) to screen for molecules that bind (I) manance of in immunogenic analogues or derivatives of (I) are used to raise antibodies and in immunosasys. The antibodies are used to locate, detect and masser of the level of are used to locate, detect and masser of the level of are used to raise antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ing treatment, tissue analysis
                                                 New proteins that bind specifically to receptors in the gastro-intestinal tract and related nucleic acid - chimaeras and antibodies, used to deliver therapeutic or diagnostic agents to, or through, the gastrointestinal tract, e.g. insulin or leuprolide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccine; prevention; treatment; infection; identification;

279917 to 280766 represent double stranded cDNA clones isolated from the human colorectal adenocarcinoma (colon cancer) cell line SW480. The cDNA clones can be used to generate antisense oligonucleotides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The cDNA clones can be used for developing agents for the diagnosis and treatment of disorders involving unwanted cell proliferation, such as neoplasia, dysplasia or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inositol 1,3,4-triphosphate 5/6-kinase; phytic acid; genetic mapping;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     H. Pylori has been strongly linked to chronic gastritis and duodenal ulcer disease. The nucleic acid sequences of the invention are used to evaluate compounds, especially activators or inhibitors of bacterial life cycle, for the ability to bind an H. Pylori or locates sequence. The nucleic acid sequences, and corresponding proteins, are also useful for generating vaccines for immunising subjects against H. Pylori or for use in detecting the presence of Helicobacter species in a sample. Antisense nucleic acid sequences of these sequences are used to inhibit expression of a gene from Helicobacter species. H. Pylori whole genomic DNA was isolated and nebulised to a median size of 2000 bp. Purified DNA fragments were blunt-ended and ligated to unique Betzt.linker adapters in 100-1000 fold molar excess. These linkers are complementary to the Batzi-cut pMPX vectors, will ethe overhang is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           linker-adapter inserts were ligated to each of the 20 pMFX vectors to construct a series of shotgun subclone libraries. The purified DNA samples were then sequenced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         not self-complementary. Therefore the linkers will not concatemerise nor will the cut vector re-ligate itself easily. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; gene expression product; diagnosis; tumour; colon cancer; colorectal adenocarcinoma; cell line SW480; cell proliferation; cytostatic; sarcoma; breast cancer; neoplasia; dysplasia; hyperplasia; ds.

protein of the invention. TIX is a phytic acid (Myc-inostic) the invention. TIX is a phytic acid (Myc-inostic) to protein of the invention. TIX is a phytic acid (Myc-inostic) in 2,3,4,5,6-hexaphosphate) biosynthetic enzyme. The ITX enzymes of the invention may be prepared recombinantly and used to raise antibodies, which are used for detecting the enzymes in situ in cells or in vitro in cell extracts. The polynucleotides of the invention may be used to reacte transgenic plants in which the ITX levels are present at higher or lower levels than normally ound. This would alter the level of where they are not normally found. This would alter the level of 1,3,4-triphosphate 5/6 knase found in those cells. In addition, it may be desirable to eliminate expression of ITX genes for certain applications. The polynucleotides also serve as a source of probes and applications. The polynucleotides also serve as a source of probes and applications. The physical mapping. Decreased amounts of phytate species, as well as for physical mapping. Decreased amounts of phytate and increased amounts of available phosphate in animal feeds such as corn would lead to improved feed efficiency. The proteins of the present invention lead to a better understanding of the phytic acid biosynthesis pathway, allowing it to be exploited for commercial uses, e.g. in animal
                                                     Novel phytic acid biosynthetic enzymes used to alter the level of the

The present sequence encodes a H. pylori cytoplasmic protein. The protein may be used in a vaccine to prevent or trast H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To dientify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                    polypeptide(s) - useful for vaccines to treat or prevent H. pyloriinfection, and to detect Helicobacter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polynucleotide; protein; nutrition; cytokine; cell proliferation; cell differentiation; immunostimulation; immunosuppression; haematopoiesis regulation; tissue growth; activin; inhibin; chemotaxis; chemotaxis; haemostasis; thrombolysis; receptor;

the invention (the encoded protein is not given in the specification). The inhibitor is a Kexz proteinase family enzyme inhibitor with a molecular weight of 11.500. The inhibitor/protein (termed Kexstatin) is expected to have pharmaceutical and pesticidal applications.
                                            sequence is the coding sequence for an example of the inhibitor of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                 The new human secreted proteins are encoded by polynucleotides obtained from human placenta, adult testes, fetal kidney, fetal brain, adult brain and adult blood cDNA libraries. The polynucleotides and proteins are predicted to have blological activities which would make them suitable for treating, preventing or amellorating medical conditions in humans and animals.                                                                                                                                                                                                                                                                                                                            activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, immune stimulating (e.g. as activity, tissue growth activity, activity, negliating activity, tesue growth activity, activity, activity, activity, activity, activity, activity, activity, activity, and thrombolytic activity. The polymucieotides are also stated to be useful for generally. The sequences are identified by a secretory leader sequence motif in the polymucleotide and it is thought that the encoded proteins have biological activity by virtue of their secreted mature. This clone was designated AC222_1. A probe for this clone is described in x08698.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is that of a cDNA sequence cc43, which was isolated from the 20q13 amplicon. It is expressed in normal tissues but not been found in the breast cancer cell line. It can be used as a probe for the detection of chromosomal abnormalities at 20q13. It and other sequences isolated from the 20q13 amplicon are consistently amplified in primary tumours. These sequences are useful as probes or as probe targets for monitoring the relative copy number of corresponding sequences from a biological sample such as tumour cells. The sequences can also be used in therapeutic applications for modulating the expression of the endogenous gene or the activity of the gene product. Examples of therapeutic approaches include antisense inhibition of gene expression, gene therapy, and monoclonal antisense that specifically bind the gene products. The products can also be used in the treatment of other diseases, e.g. age-related macular degeneration, jeber's congenital amaurosis and retnitis
                                                                                                                                                                   20q13 amplicon; chromosome 20; tumour; detection; chromosomal abnormalities; probe; gene therapy; antisense inhibition; treatment; age-related macular degeneration; retinitis pigmentation; Leber's congenital amaurosis; ds.

This invention describes the construction of a novel insect cell vector (A) which contains a nucleic acid (I) that codes for a protein (II) of the DRAD-superfamily. (A), and recombinant insect viruses derived from them, are used to express recombinant (II), particularly RNA and DNA helicases. (II) are potentially useful for: (a) production of cell lines for research into cancer, inflammation and apoptosis, or for clarifying the mechanism of action of drugs, and (b) to identify pharmaceutical activity in known compounds, e.g. anticancer and antiviral activities. (II), which are difficult to express in bacteria and yeast, are expressed at high lavel in insect cells, e.g. 300-400 mg per 109 cells. This sequence encodes a human RNA-helicase pl35 protein which is used in the description of the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New insect cell vector containing the sequence encoding a DEAD-superfamily protein, particularly a nucleic acid helicase, used e.g. for identifying potential pharmaceuticals

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes secreted and transmembrane polypeptides and their polynuclectides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New secreted and transmembrane polypeptides and their polynucleotides, useful for treating blood coagulation disorders, cancers and cellular adhesion disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion, disorders. They may also be used to raise antibodies. x233891 to '234338, and Y41685 to Y41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chen J;

bones)) encoding proteins influencing bone development in mammals. The proteins of the invention reduce and/or inactivate bone extension (i.e. development), with exception of the skull and have osteopathic activity. The nucleic acid molecules, proteins and antibodies can be used in diagnostic or pharmaceutical compounds e.g. for gene therapy. The methods and nucleic acid molecules, etc. are useful for production of transgenic animals, especially a transgenic, are useful for production of transgenic animals, especially a transgenic, e.g. spondyloepiphysal dysplasia and achodroplasia. This sequence encodes a human LOBO protein described

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      kallfxrein 2 (hKZ) DNN. The method comprises: (a) contacting DNA obtained by reverse transcription (RT) of RNA from a human physiological sample by reverse transcription (RT) of RNA from a human physiological sample by reverse transcription (RT) of RNA from a human physiological sample obligionuclectides to amplify the DNA by PCR to yield amplified hKZ DNA, where the conditions amplify the DNA obtained by RT of RNA from at least one cells; and (b) detecting the presence of the amplified hKZ DNA. The method can be used for detecting, monitoring the progression of and pathologically staging prostate cancer. The present sequence represents the coding strand of native genomic hKZ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diagnostic; pharmaceutical; gene therapy; transgenic animal; disease; spondyloepiphysal dysplasia; achondroplasia; human; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       present invention describes a diagnostic method for detecting human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

DSM 7211 is made by (1) inserting a fragment of pC:2 (contg. the C kappa exon) into pT2-19(R); (2) inserting a 1.2 kb fragment of pHBc kappa (contg. the intron enhancer element);

                                                                                  codon of this exon.

DSM 7211 was introduced into embryonic mouse stem cells by electroporation. Wild type mice have in their serum no antibodies carrying the human kappa gene constant region, but in mice homozygotic for the mutation, such antibodies were present at
(3) inserting a 1.1 kb fragment contg. the neomycin resistance gene of pMCIneo; (4) inserting the 2.8 kb fragment of pHJKappa (contg. the J1-5) elements); then (5) finally inserting a 427 bp fragment made by PCR on mouse germ line DNA using one primer (Q54683) which hybridises 12 bp after the start of the C kappa exon and another (Q54684) which hybridises 137 bp after the stop

Sequences A31040-A32093 represent novel plant microsatellite sequences and associated flanking species. The sequences comprise a central core repeat sequence, especially selected from the sequences A32094-A32096 with left and right flanking sequences. The polynuclectide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in physical mapping, in positional cloning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for oligonuclectide fingerprinting and library screening and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Plant microsatellite sequence; core repeat sequence; detection; probe;

ö

and associated flanking species. The sequences comprise a central core repeat sequence, especially selected from the sequences A32094-A32096 with left and right flanking sequences. The polynucleotide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in physical mapping, in positional cloning of genes, in variety identification and in evaluations of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for oligonucleotide fingerprinting and library screening and to design primers for microsatellite-primed PCR. Microsatellite markers are useful to locate specific economically useful genes in plant genomes.

Sequences A31040-A32093 represent novel plant microsatellite sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New non-A, -B, -C, -D and -E (n-(ABCDE)) hepatitis DNA libraries - used to develop prods. for the detection, diagnosis, prevention and treatment of n-(ABCDE) hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polypeptide associated with non-A, non-B, non-C, non-D, non-E hepatitis virus (n-(ABCDE) virus) infection, and is obtained by preparing a phage from a phage lambda gill library of MY 190 DNA (ATCC 75284) n-(ABCDE) hepatitis serum, plating to form plaques, and screening the phage plaques for the production of polypeptides immunoreactive with n-(ABCDE) serum n-(ABCDE) hepatitis virus polypeptides can be used for the production or detection of antibodies, and in vaccines. The antibodies can be used for detection, diagnosis and in passive immunotherapy. The DNA can also be used in detection and diagnosis, and as hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      probes for identification of further n-(ABCDE) hepatitis coding sequences. Culture systems producing the n-(ABCDE) polypeptides can be used in screening studies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8XXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A00010 to A02716 represent polynucleotides isolated from cDNA libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated on the cell from which the test sample was derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Labat I;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of pre-metastatic or metastatic cancerous states, stages of cancer, or responsiveness of cancer to therapy). This is particularly for breast cancer, oestrogen receptor-positive breast cancer, oestrogen receptor-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polynucleotide library used to determine cancerous states of mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

```
represent the EST-related proteins corresponding to 242265 to 243052.
The S ESTs can be used for producing secreted human gene products.
They can be used for producing secreted human gene products.
They can be used for producing secreted human gene products.
They can be used for producing secreted human gene products.
They can be used to identify and isolate 5' untranslated regions (UTRS) and upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide or the insertion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of mew secreted proteins is valuable. Z42249 to be exemplification of the present sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel secreted protein 5' expressed sequence tag sequences used in diagnostic, forensic, gene therapy, and chromosome mapping procedures
                                                         Human; 5' EST; expressed sequence tag; secreted protein; diagnosis; gene therapy; chromosome mapping; upstream regulatory sequence; forensic; location; development; protein synthesis; stability;
Human 5' EST isolated from a cDNA library SEQ ID NO:402.

```
useful in cancer, autoimmune or degenerative disease therapy.
Increased Bim expression or Bim activity is useful, e.g. for
treatment or prophylaxis in conditions such as cancer and deletion
of autoreactive lymphocytes in autoimmune disease. Decreased Bim
expression of Bim activity is useful in regulating inhibition or
prevention of cell death or degeneration such as under cytotoxic
conditions during e.g. gamma-irradiation and chemotherapy or during
HIV/AIDS or other viral infections, ischemia, myocardial infarction,
hypoxia, degenerative diseases or for prolonging the survival of
cells being transplanted for treatment of disease. Since Bim is
expressed in germ cells, modulating Bim expression or Bim activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        in therapy, diagnosis, antibody generation and involving modulation of physiological cell death. These therapeutic molecules may act as either antagonists or agonists of Bim's function and will be

The present sequence encodes the short form (5) of murine Bim, or Bc1-2 interacting mediator of cell death (see W98154), a novel comport of the Bc1-2 family that is capable of inducing cell death (apoptosis) and which acts as a 'death-ligand' for certain members of the pro-survival Bc1-2 family. Bim is a BH3-only protein, as the conly BH3-only protein for which it encompasses is BH3. It is the only BH3-only protein for which it encompasses is BH3. It is the conly BH3-only protein for which splice variants exist. These result in the expression of a variety of isoforms, i.e. BHm-5, Bim-L and Bim-EL (see W98154-56). cDNAs encoding these murine Bim cerombinant Bc1-2 protein. The murine Bim gene has been mapped to chromosome 2 at bands F3-G. Human Bim-L and Bim-EL isoforms have chromosome 2 at bands F3-G. Human Bim-L and Bim-EL isoforms have chain was shown to regulate the pro-apoptotic activity of Bim. EL. Chain, is a much more potent killer than either Bim-L or Bim-EL. The invention provides variant which does not bind to dynein light chain. Is a much more potent killer than either Bim-L or Bim-EL. That cannot bind, couple or otherwise associate with a dynein light chain. The identification of Bim permits the interpart while distributional design of a range of products for use in the horaw. Alarmosis antiholy departation and rational design of a range of products for use in the horaw.

```
A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(") as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNA hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS.

**X40826 to X41093 represent 5' expressed sequence tags (ESTS) for human secreted proteins, and encode the proteins given in Y01602 and Y11994 to Y12260, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used for products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopolesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, composite activity, composite activity, composite activity, chemotachic/chemokinetic activity, haemastopic activity, haemastopic activity, the activity, composite activity, one other activity, and child mamatory activity, tumour inhibition activity or other activity, and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter for directing extracellular secretion of a polypeptide can be used for directing activity a polypeptide into a membrane, or importing a polypeptide into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

New isolated member of the Bcl-2 family, Bim used in, e.g. cancer treatment

Claim 3; Page 94-95; 145pp; English.

The present sequence encodes the long form (L) of murine Bim, or member of the Bol-2 family that is capable of inducing cell death (apoptosis) and which acts as a 'death-ligand' for certain members of the Bol-2 family that is capable of inducing cell death (apoptosis) and which acts as a 'death-ligand' for certain members of the pro-survival Bol-2 family. Bim is a BH3-only protein, as the only Bel-2 homology region which splice variants exist. These only Brotesin for which splice variants exist. These only BH3-only protein for which splice variants exist.

Esult in the expression of a variety of isoforms, i.e. Bim-S, Bim-L and Bim-EL (see W98154-56). CDNAS encoding these murine Bim isoforms were obtained from a T lymphoma cDNA library using human chromosome 2 at bands F3-G. Human Bim-L and Bim-EL isoforms have also been identified (see W98157-58). Binding the dynein light chain is a much more potent Killer than either Bim-L or Bim-EL that cannot bind, couple or otherwise associate with a dynein light chain. The identification of Bim permits the with a dynein light chain. The identification of Bim permits the with a dynein light chain. The identification and involving modulation of physiological cell death. These therapeutic molecules may act as either antegonists or agonists of Bim's function and will be useful in cancer, autoimmune or degenerative disease therapy. Increased Bim expression or Bim activity is useful, e.g. for treatment or prophylaxis in conditions such as cancer and delice of prevention of Bim activity is useful, as cancer and delice of prevention of Bim activity is useful, as under cytocxic conditions during e.g. gamma-irradiation and chemotherapy or during e.g. gamma-irradiation and chemotherapy encoditions during e.g. gamma-irradiation and chemotherapy encoditions during e.g. gamma-irradiation and chemotheraph encoditions during e.g. gamma-irrad cells being transplanted for treatment of disease. Since Bim is expressed in germ cells, modulating Bim expression or Bim activity is useful, e.g. as a contraceptive or method of sterilization by

```
Sequences A31040-A32093 represent novel plant microsatellite sequences and associated flanking species. The sequences comprise a central core repeat sequence, especially selected from the sequences A32094-A32095 with left and right flanking sequences. The polynuclectide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in physical mapping, in positional choning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for
                                                                                                                                                                                                                                                                                                         Plant microsatellite sequence, core repeat sequence, detection, probe, DNA polymorphism, genome mapping, physical mapping; fingerprinting; variety identification, genetic variability evaluation, primer, ss.

Sequences A31040-A32093 represent novel plant microsatellite sequences and associated flanking species. The sequences comprise a central core repeat sequence, especially selected from the sequences A32094-A32096 with left and right flanking sequences. The polynucleotide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in physical mapping, in positional cloning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for oligonucleotide fingerprinting and library screening and to design
                                                                                                                                                                                                                                                                                                         Plant microsatellite sequence; core repeat sequence; detection; probe; DNA polymorphism; genome mapping; physical mapping; fingerprinting; variety identification; genetic variability evaluation; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New plant microsatellite markers and associated flanking species for the detection of polymorphic genetic markers -

calcium ion channel alpha 1 subunit gene and part of untranslated calcium ion channel alpha 1 subunit gene and part of untranslated sequences. The channel is related to familial hemiplegic migratine (FHM) calcium ion channel is related to familial hemiplegic migratine (FHM) associated with a gene present in humans on chromosome 19p13.1-13.2. The cancoding gene can be used to localise or identify genes related to or encoding gene can be used to localise or identify genes related to or also epilopsy. The isolated or a recombinant nucleic acid can also be used to distinguish between alleles of the corresponding gene. Cells and animals containing recombinant expression vectors comprising the nucleic acid can be useful in study, development and treatment of migraine, FHM.

EA-2 and epilepsy. Proteins or peptides encoded by the nucleic acid can be useful in study, development and treatment of migraine, FHM.

EA-2 and epilepsy. Proteins or peptides encoded by the nucleic acid and natural or synthetic antibodies against the proteins can be used to diagnose FHM. EA-2, migraine and other neurological conditions associated with cation channel disfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequences shown in V29330 to V29371 represent the 47 exons and flanking

ö

Calcium ion channel alphal subunit exons 33, 34/intron) partial sequence.

V29360 standard; DNA; 559 BP.

TESULT 33

V29360;

31-JUL-1998 (first entry)

Calcium ion channel alphal subunit; human; episodic ataxia type 2; familial hemiplegic migraine; FHM; EA-2; treatment; diagnosis; exon; intron; ss.

Gaps

Length 590;

Score 17; Pred. No.

New isolated member of the Bcl-2 family, Bim used in, e.g. cancer treatment

ä

O'Connor L, O'Reilly

Huang DCS,

Claim 3; Page 96-97; 145pp; English.

The present sequence encodes the extra long form (EL) of murine Bim, or Bol-2 interacting mediator of cell death (see w88156), a novel member of the Bol-2 family that is capable of inducing cell death (apoptosis) and which acts as a 'death-ligand' for certain members of the pro-survival Bol-2 family. Bim is a BH3-only protein, as the only BH3-only protein for which splice variants exist. These only BH3-only protein for which splice variants exist. These result in the expression of a variety of isoforms, i.e. Bim-5, Bim-Land Bim-EL (see w98154-56). CDNAS encoding these murine Bim isoforms were obtained from a T lymphoma cDNA library using human isoforms were obtained from a T lymphoma cDNA library using human isoforms were obtained from a T lymphoma cDNA library using human isoforms were obtained from a T lymphoma cDNA library using human chromosome 2 at bands F3-G. Human Bim-EL and Bim-EL isoforms have also been identified (see w98157-58). Binding the dynein light chain was shown to regulate the pro-apoptotic activity of Bim. Bim-S, the splice variant which does not bind to dynein light chain, is a much more potent Killer than either Bim-I or Bim-EL.

The invention provides variants (see w98159-68) of murine and human Bim-L or Bim-EL that cannot bind, couple or otherwise associate with a dynein light chain. The indentification of Bim permits the intentional design of a range of products for use in therapy, diagnosis, antibody generation and involving modulation of physiological casi death. These therapeutic molecules may act as either antagonists or agonists of Bim's function and will be useful in cancer, autoimmune or degenerative disease therapy. Increased Bim expression or Bim activity is useful, e.g. for treatment or prophylaxis in conditions such as cancer and deletion of autoreactive lymphocytes in autoimmune disease. Decreased Bim expression of Bim activity is useful in regulating inhibition or prowention of cell death or degeneration such as under cytotoxic conditions during e.g. amma-irradiation and chemotherapy or during HIV/AIDS or other viral infections, ischemia myocardial infarction, cells being transplanted for treatment of disease. Since Bim is expressed in germ cells, modulating Bim expression or Bim activity hypoxia, degenerative diseases or for prolonging the survival of cells being transplanted for treatment of disease. Since Bim is is useful, e.g. as a contraceptive or method of sterilization by preventing generation of fertile sperm.

This sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activity, chemotactic/chemokinetic activity, activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The EST sequences are also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present sequence includes an exon encoding the C-terminus (see W98147) of a soluble form of a novel human cysteine-rich tumour necrosis factor receptor family member termed TRAIN-R. It comprises clone GJ156, obtained from a Clontech human adult lung cDNA ilbrary. The encoded 30-amino acid C-terminal peptide is identical to amino acids 121-149 of the composite TRAIN-R protein given in W98146 and to amino acids 121-150 of the C-terminus of murine TRAIN-R short form (secreted protein, see W98144). The soluble protein is expected to inhibit signalling by the full-length TRAIN-R. Human TRAIN-R is expressed at low levels in every tissue and cell line tested thus far, with higher expression detected in heart, prostate, ovary, testis, peripheral blood lymphocytes, thyroid and adrenal gland. Cell death can be induced by administering an agent capable of inhibiting the binding of TRAIN-R to its ligand. A claimed method of treating, or reducing, the advancement, severity or effects of an immunological disease in a mammal comprises administering a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /product= "TRAIN-R secreted form C-terminus" 45..790

This sequence encodes a Streptococcus pneumoniae protein of the invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunosopens or antigens. Immunosopenic or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnostic assays. The sequences are useful for the detection or compositions is of a preumonate infection, by contacting a sample to be tested with them. Agents, capable of antagonising, inhibiting or interfering with the function or expression of the protein or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, they can be used to treat bacterial pneumonia, which has high rates in young children, the elderly, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism, or with immunosuppressive disorders, especially AIDS. They can also be used to treat pneumococcal septicaemia, otitis media, sinusitis, and

pharmaceutical composition which comprises a TRAIN'R blocking agent, e.g. soluble TRAIN'R. TRAIN'R can be fused to an immunoglobulin to produce a fusion protein which may be targeted to various sites. It can be used in binding assays, and to identify antagonists and agonists. Anti-TRAIN'R antibodies can be used to reduce the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination between the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and

These sequences were used in the construction of NEVAC-and ALVAC-based recombinant viruses containing the MAGE-1 gene. MAGE-1 is expressed in primary melanoma tumour cells, melanoma-derived cell lines and certian tumours of non-melanoma origins but not in normal cells except in testis. A first PCR fragment containing the last 18 bp and the initial 24 nucleotides of the MAGE-1 gene was generated and ligated to a second PCR fragment amplified from plasmid pT218RMAGEI which contains the initial 546 bp of the MAGE-1 coding sequence. The reminnal sequence of MAGE-1 was amplified and a fusion product was generated containing the H6 promoter and the full length MAGE-1 sequence. This construct may be introduced in to the poxvirus derived plasmids,

The interpolation of the recombination of the recombination of the refore induces an immunological response. (I) may be used to vaccinate patients against a wide range of diseases and disorders be used to vaccinate against a wide range of diseases and disorders be used to vaccinate against diseases such as rabbies, influenza and Newcastle Disease. It is particularly useful for immunising against lymphocytes and tumour cells for use in cell-based immunotherapeutic modalities for cancer. (I) also have enhanced safety compared to unattenuated viruses (attenuation reduces the virulence of the viruses) and known recombinant poxvirus vaccines. This increased level of safety reduces the possibility of a 'tunaway' infection in the host and reduces the chance of transmission from vaccinated to unvaccinated individuals
                                                                                                                                                                                                                                                                                                                                                                                                           and contamination of the environment. The present sequence represents a H6/MAGE-1 expression cassette and flanking regions from pMAW037
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymerase chain reaction; primer; amplify; NYVAC; ALVAC; recombinant; human; MAGE-1; melanoma-associated antigen; MZ2-E; testis; pTZ18RWAGE1; primary melanoma tumour cell; melanoma-derived cell line; tumour; poxvirus; antigenic response; immunological response; pathogen; ss.
                                                                                                                                         The present invention describes a recombinant poxvirus (I), comprising exogenous DNA encoding an antigenic determinant of a pathogen which is then expressed in vivo in infected host cells after administration to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                               Recombinant poxviruses comprising exogenous DNA encoding antigenic determinants useful in immunotherapy to immunize against cancers and other diseases such as influenza, Newcastle Disease and rabies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó

                                                                                                                                                                                               containing the vaccinia He promoter and the human MAGE-1 gene which encodes human melanoma-associated antigen MZ2-E, in vCP235 and pMAW037, respectively. These sequences were used in the construction of NYVAC- and ALVAC-based recombinant viruses containing the MAGE-1 gene. MAGE-1 is expressed in primary melanoma tumour cells, melanoma-derived cell lines and certian tumours of non-melanoma origins but not in normal cells except in testis. A first profit fragment containing the last 18 bp and the initial 24 nucleotides of the MAGE-1 gene was generated and igated to a second PCK fragment amplified from plasmid pT218RAMGE1 which contains the initial 546 bp of the MAGE-1 coding sequence. The terminal sequence of MAGE-1 was amplified and a fusion product was generated containing the H6 promoter and the full length MAGE-1 sequence. This construct may be introduced in to the poxylius derived plasmids. ALVAC and NYVAC. The resulting viruses may be used in a composition for inducing an antigenic or immunological response, ie. for immunisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

                                                                                               patient and therefore induces an immunological response. (I) may be used to vaccinate patients against a wide range of diseases and disorders depending on the type of antigen encoded by the exogenous DNA. (I) may be used to vaccinate against diseases such as rables, influenza and Newcastle Disease. It is particularly useful for immunising against cancers. The poxyrius (I) also provides a means of manipulating modalities for cancer. (I) also have enhanced safety compared to mattenuated viruses (attenuation reduces the virulence of the viruses) and known recombinant poxyrius vaccines. This increased level of safety reduces the possibility of a 'runaway' infection in the host and reduces
The present invention describes a recombinant poxvirus (I), comprising exogenous DNA encoding an antigenic determinant of a pathogen which is then expressed in vivo in infected host cells after administration to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                          and known recommence.

reduces the possibility of a 'runaway' infection in the possibility of a 'runaway' infection of transmission from vaccinated to unvaccinated individuals the chance of transmission from vaccinated to unvaccinated individuals and contamination of the environment. New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders

Claim 1; Page 271; 464pp; English.

This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. x27302) for increasing the stability of the fused protein as

compared to the human protein only.

The invention relates to 123 novel genes and their fragments (nucleic acid sequences: X27311-X27449; amino acid sequences Y02650-Y02788) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 123 polynucleotides, based on which tissues they are most highly expressed in (see X27311 for described
                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the 3' region of hepatitis C virus RNA. The original sample was obtained from human and chimpanzee plasma. RNA was isolated from several samples and homology compared, and the respective sequence of about 1900 - 2500 nucleotides of the 5' terminus and 1100 nucleotides of the 3' terminus determined.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                      The present sequence encodes a mammalian forkhead activin signal transducer (FAST) protein, designated FAST2. The protein is a winged-helix/forkhead domain protein. The protein is an inducer of the homeobox gene goosecoid (gsc) by transforming growth factor (TGF)-beta or activin signaling. FAST2 binds to a nucleotide sequence in the gsc promoter. The FAST2 protein is useful for modulating signal transduction in a TGF-beta or activin signaling pathway, which involves FAST2 as transcription factor, by modulating the formation of FAST2 Smad2/Smad4/FAST2 complex. Inhibition of FAST2
                                                                                                                                                                                                                                                                         binding to its target DNA site inhibits FAST2 specific TGF-beta signaling, which is associated with wound healing inflammation, and tumour progression. Excessive signaling is associated with scarring, arthritis and fibrosis in numerous diseases, including fibrosis of the liver and kidney.
                                                                                                 New mammalian transcription factor, useful for preventing or treating disorders associated with transforming growth factor beta or activin signaling pathways ^{\rm -}

protein (CIVTA), the human MAGE-1 tumour-associated antiqen and hexahistidine tail. A vector designed for recombinant expression of the fusion protein in Escherichia coli is provided. The CIVTA moiety provides expression of soluble fusion protein, facilitates affinity purification of the fusion protein, and also acts as a finity purification of the fusion protein, and also acts as a finity purification of the fusion protein, and also acts as a mimunological fusion partner, e.g. Clyta-MAGE-1-His. These novel fusion proteins provide vaccines for immunotherapy of melanomas or other MAGE-associated tumours like breast, bladder, lung and non-small cell lung cancer, head and squamous cell carcinoma, colon

                                                                                                                            invention relates to MAGE proteins fused to an immunological fusion partner such as LPD. The LPD molety provides the fusion protein with additional exogenous T-cell epitopes and also increase expression levels in E. coli. The lipid tail ensures optimal presentation of the antigen to antigen presenting cells. The affinity tag facilitates purification. The novel fusion proteins provide vaccines for immunotherapy of melanomas or other MAGE-associated tumours like breast, bladder, lung and non-small and oesophagus carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is shown folded into secondary structure in the specification. It was compared with other sequences available in the literature to design probes specific for SRB. The probes can be used for the rapid identification and quantification of SRB in a sample, e.g. oil-field prodm. waters, water from water treatment facilities, or samples from the gut of ruminant animals.
                                                                                  of Haemophilus influenzae B, the human
                                          Is DNA sequence codes for a fusion protein (see Y05590) composed lipidated protein D (LPD) of Haemophilus influenzae B. the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Assay for sulphate-reducing bacteria - by hybridisation using a labelled oligo-nucleotide probe corresponding to 16S rRNA of the

conjunctivitis, pneumonia, bacteremia, meningitis, sinusitis, pleural empyema, endocarditis or infection of the cerebrospinal fluid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Streptococcus pneumoniae polynucleotides - useful for developing products for diagnosis, prevention and treatment of infections e.g. pneumonia, bacteremia, meningitis or endocarditis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of a Streptococcal polypeptide coding region. The polypeptide can potentially be used for the diagnosis and prevention of bacterial infections, especially SP infection. It may be used for the treatment of diseases such as otitis media,
                                                                                                                                                                                                                                                                                        Polypeptide; ORF; open reading frame; infection; bacterial; streptococcal; bacteremia; diagnosis; prophylaxis; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Seguence 1592 BP; 454 A; 317 C; 376 G; 445 T; 0 other;

The DNA sequence of the invention. The DNA sequences were isolated from Streptococcus pneumoniae strain oloo993 (NCIMB 40794). The Streptococcus pneumoniae proteins of the invention can be used to identify compounds which interact with and inhibit or activate the activity of the proteins. Antagonists can be used to incertain and interact with and inmunisation. They can also be used to induce an immunological response in a mammal by inoculation with the S. pneumoniae proteins or delivery of the encoding nucleic acids in a vector adequate to produce antithody andor T cell immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bloactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian extracellular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal progression of pathogenesis in infections initiated other than by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                             Neurodegenerative polypeptide; HHPDZ65; stroke; pain; epilepsy; therapy; neurodegenerative disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polypeptide of the invention. HHPDZ65 is useful for the treatment of stroke, pain, epilepsy, neurodegenerative diseases and others. The DNAs and proteins are useful in a method for screening to identify compounds which stimulate or inhibit the function of the HHPDZ65 proteins. The polypeptides are useful in a process for diagnosing a disease or a susceptibility to a disease in a subject related to expression or activity of the HHPDZ65 polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                  HHPDZ65 polypeptide(s), their corresponding DNA, antibodies, agonists and antagonists - are useful in the treatment of stroke, pain, epilepsy and neurodegenerative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

Methods have been developed for identifying a compound, which binds to a human or murine D6 protein, an allelic variant or a fragment comprises detecting binding of the test compound to the protein. Also described in the present invention are: (1) a method for identifying a compound capable of treating a disorder characterised by aberrant D6 nucleic acid expression of D6 protein activity; (2) a method for treating a subject having a disorder characterized by aberrant D6 nucleic acid expression comprising administering to the subject a D6 modulator such that treatment of the subject occurs; and (3) methods for identifying a compound that modulates the activity of a Human or murine D6 protein, an allelic variant or a fragment. The methods are useful for identifying compounds capable of treating disorders, especially a respiratory inflammatory disorder, characterized by aberrant D6 nucleic acid expression or D6 protein activity. In particular, the disorder is asthma. D6 modulators are used to treat asthma. The present sequence encodes the murine D6 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transforming growth factor-beta superfamily signalling; modulator; Smad2; TGF-beta; detection; FAST-1; MH2 domain; Smad interaction domain; SID; treatment; developmental; disorder; immunological; cancer; diagnosis; ss.

```
a method to detect a compound capable of modulating transforming growth factor-beta (TGT-beta) superfamily signalling. The invention describes accomplex which forms between FAST-1 and Smad2 and this complex is specifically induced by signals generated by a TGF-beta superfamily member. A domain of FAST-1 directly interacts with Smad2 and this molecules, namely, the MH2 domains of the two interacting molecules, namely, the MH2 domain of Smad2 and the Smad interacting for the detection and treatment of conditions involving abnormal TGF-beta superfamily signalling. They can be used to treat e.g. developmental disorders, immunological disorders and cancer. The products can also be
                                                        Modulating TGF-beta superfamily signalling - comprises use of compounds identified in assays with Smad2, FAST-1 and Smad3, used develop products for treating, e.g. developmental disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence encodes a mouse FAST-1 protein which is used in
                                                                                                                                                                                                                                                                                                                                                                                     Example XII; Page 70; 107pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             used for detection and diagnosis.

The sequences are also useful in producing pharmaceutical compositions for treatment of pancreatic tumors. $25888-$23014 represent expressed sequence tag (EST) fragments derived from a human pancreatic tumor cDNA library and which encode the proteins represented in $73814-$774252.
This nucleotide sequence comprises human tumour rejection antigen precursor (TRAP) MAGE-Al cDNA, which encodes a 309-amino acid college by 1901 peptide (see W8154B). MAGE-Al cDNA shows homology to novel human MAGE-Cl cDNA (see V65720), especially in exons 2 and 3.

The open reading frame of MACE-Cl, however, is about 2 kb longer than that of MAGE-Al most of the difference being accounted for by a large repetitive sequence. MAGE-Cl (see W81546) is a novel member of the MAGE family that may be recognised by cytotoxic rells, leading to lysis of the tumour cells which express it. It is expressed in a variety of tumours and in normal testis cells, but not by other normal cells. The invention provides MACE-Cl and MACE-C2 nucleic acids and polypeptides, useful e.g. in a claimed method for determining the presence of cytolytic I cells specific
                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human nucleic acid sequences from pancreatic tumors, and related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Dahl

The invention provides bovine and human GnT-IV enzymes that can be used for converting sugar chain subunits having one structure to another structure. Vectors containing the DNA sequences encoding these enzymes can be used to transform host cells for the production of the GnT-IV enzymes. The enzymes are useful in the production of branched oligosaccharides and polysaccharides which are difficult of access by other methods. They are also useful in the production of drugs, reagents and foods and in modifying the properties of biopolymers containing sugar chains. The enzyme may also be used for the preparation of glycoproteins
                                                                                                                                                                                                                                                                                                                                                                                                                              Beta(1 -> 4)-N-acetylglucosaminyl-transferase; GnT-IV; bovine; human;

HCDR proteins are active in interphase, and are used for the treatment or prevention of inflammation and disorders associated with cell proliferation and apoptosis. HCDR may be administered to a patient having a disorder associated with an increase in apoptosis,

The present sequence is the coding sequence of human TRAF four associated factor TRAF2. The gene was discovered by screening a human placenta cDNA library using a two-hybrid system. The protein associates with the TRAF domain located at the carboxyl-terminal of TNF seceptor associated factor 4 (TRAF4), which is believed to be an orcoprotein. Antibodies that bind to TNF four associated factors (TRAFs) may be used to treat or diagnose tumours (e.g. breast cancer) when alsothogo at an appropriate drug, precursor or enzyme. Antagonists, and matisense sequences of TRAFs may be used to treat cancers. TRAF proteins, antibodies that recognise them and DNAs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nitrite reductase; transgenic crop; transgenic tree; detoxification;

This sequence encodes the human cell division regulator-1 (HCDR-1) protein of the invention. Polynucleotides complementary to the HCDR-1 coding sequence can be used as probes to detect the DNA in a sample. The polynucleotide sequences encoding HCDR may be used to prevent/treat inflammation and disorders associated with cell proliferation and apoptosis and in assays that detect activation of cancers. Polynucleotides encoding HCDR may be used for the diagnosis of conditions associated with expression of HCDR, including disorders associated with cell proliferation/apoptosis e.g. adenocarcinoma and AIDS. The polynucleotides may also be used in Southern or Northern analysis, dot blot, or other membrane based technologies; in PCR technologies; or in dipstick, pin, or ELISA assays or microarrays utilising fluids or tissues from patient biopsies to detect altered HCDR expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ó

The present cDNA sequence encodes human epidermal protein-6 (HEPI). The cDNA clone is derived from PTHYNOT03 library which was constructed using fenal scolated from left parathyroid tissue of a 69-year-old caucasian female during a partial parathyroidectomy. Recombinant vectors comprising HEPI cDNA are introduced into host cells for protein expression. The HEPI proteins are useful for the treatment of epithelial disorders, including dyshidrotic cozema and scabies, cell proliferative disorders including actinic keratosis and arteriosclerosis, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tumour rejection antigen; vaccine; cancer; E antigen precursor gene; ss.

                                                                                                                                                                                                                                                                                The gene encodes a nitrite reductase gene isolated from Populus nigra. The gene is useful in generation of street trees with a high power for clarfiying NO2, an atmospheric pollutant. The gene can also be used in transgenic plants, esp. crops, bred to contain less nitrosamines (a carcinogenic substance present in food).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 dyshidrotic eczema; cell proliferative disorder; actinic keratosis; arterioscierosis; aucoimmune disorder; inflammatory disorder; acquired immune deficiency syndrome; AIDS; Addison's disease; antiHIV; dermatological; anitarterlosclerotic; antiinflammatory;

This antigen is expressed along with antigens "D. F and A" by the human melanoma cell line MZ2-MZE. These antigens are all recognised by cytolytic T cells. A subline of MZ2-MZE. MEL3 Which only expresses antigen E. This cell line was chosen as a source for the isolation of this sequence. This sequence was found to contain three exons. The open reading frame for antigen E was contained within the first two exons. An ArG is, located at position 66 of exon 3 and is followed by an 828 base pair reading frame. The three exons contain 65, 73 and 1551 base pairs. During the isolation of this sequence two different but closely reated CDNAs were also identified. These cDNAs, when tested, did not transfer expression of antigen E, but they did show substantial homology to the antigen E cDNA sequence. These new cDNAs represent a
                                                   This sequence represents the E antigen precursor gene. The invention relates to a tumour rejection antigen sequence that is useful as a tumour rejection antigen for vaccination against cancerous

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          072476 encodes tumour rejection antigen E, another sequence 072470 encodes melanoma antigen.3 (MAGE-3) a tumour rejection antigen precursor. Melanomas characterised by the expression of MAGE-3 can be detected, or monitored, by contacting a test sample with an agent that can recognise MAGE-3. The melanoma can be treated by the administration of cytolytic T cells specific for the complex of antigen D (the mature rejection antigen derived from MAGE-3) and a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
new family of genes refered to as melanoma antigens (MAGE) (see also Q32352-69).
                                                                                                                                                                                                      Gaps

This E precursor antigen gene sequence was obtd. from a cosmid derived from DNA of the E+ subclone MZ2-MEL 43.

```
This sequence represents a nucleic acid molecule designated Gene 85 from the human cDNA clone HSDFY29 (deposited as clone ATCC 209076) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. V95502) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 186 movel genes and their fragments (nucleic acid sequences: V59511-V58812; amino acid sequences W74731-W75025) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the presence of mutations in the new polyneclectides, correcting the presence of mutations in the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see V5911 for described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel human nucleic acid (cDNA) sequences (A), that are highly expressed in uterine tumour tissue and which have anticancer and cytostatic activity. (A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of uterine or endometrial cancer; (ii) directly for treating these forms of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            <u>ы</u>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               derived polypeptides, for treatment of uterine and endometrial cancer and identification of therapeutic agents ^{-1}

ö
expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTs from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. Z41981-Z42121 represent EST fragments derived from a human endometrium tumour cDNA library which encode the protein sequences represented in Y59941-Y60328.
                                                                                                                                                                                                                                                                                                                                                                                                                          Neurodegenerative polypeptide; HHPDZ65; stroke; pain; epilepsy; therapy; neurodegenerative disease; ss.
                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HHPD265 polypeptide(s), their corresponding DNA, antibodies, agonists and antagonists - are useful in the treatment of stroke, pain, epilepsy and neurodegenerative diseases

Expression does not require temp shifts or addition of inducers. (Formate is produced naturally by microorganisms in the late, anaerobic growth phase).

invention. HHPDZ65 is useful for the treatment of stroke, pain, epilepsy, neurodegenerative diseases and others. The DNAs and proteins are useful in a method for screening to identify compounds which stimulate or inhibit the function of the HHPDZ65 proteins. The polypeptides are useful in a process for diagnosing a disease or a susceptibility to a disease in a subject related to expression or activity of the HHPDZ65 polypeptides.

This sequence encodes the HHPD265 neurodegenerative polypeptide of the

```
This polynucleotide comprises clone pA1276 that codes for human T-cell surface antigen CD97 (see W48756). It was isolated from a T-cell library enriched for mitogen-induced genes. The invention relates to the previously unrecognised alpha subunit of CD97 that acts in the establishment and maintenance of inflammation. Soluble CDD97 acts as an adhesion factor for endothelial cells and smooth muscle cells, implicating it as a modulator of atherosclerosis. CD97 alpha also acts as a motility factor to cells bearing the alpha(V)beta-3 receptor, indicative of a role in angiogenesis. CS9luble CD97 alpha1, alpha2, and alpha3 subunits (having different combinations of EGF repeats) all originate as a proprotein with the beta subunit (see W48756). Host cells transfected with a nucleic acid encoding a CD97 alpha subunits are claimed. CD97 alpha subunit polypeptides, nucleic acids, antibodies and antagonists (e.g. CD97 subunit antisense nucleic acids) are used in claimed methods for: determining the degree of inflammation and site:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 inhibiting atheroslerosis; and treating or inhibiting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Overlapping clones which make up this sequence were isolated from a mouse Peripheral Blood Lymphocyte lambda gt10 cDNA library. The protein encoded by this sequence is purified and can mediate the cytolytic activity of mammalian cells. It specifically distinguishes tumour cells making it a candidate for the development of products for the immunodetection and immunotherapy of tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        T-cell surface antigen; CD97; human; inflammation; angiogenesis; atherosclerosis; human; ss.

Overexpression of nitrate reductase (NR) can stimulate the early development of plants, shortening the duration of the vegetative phase and causing earlier germination, flowering and ripening by about two weeks. Overexpression of NR can also cause the level of nitrate stored in a plant to be reduced, reducing risks to health and also possibly improving organoleptic qualities. The NR gene was tuncteduced into plants by transforming a strain of Agrobacterium tunmefaciens with a plasmid and using it to infect the subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Xenopus protein; chordin; dorsal tissue; neural tissue; vertebrate; endodermal differentiation; treatment; neurodegenerative disease; nerve cell; transforming growth factor; TGF; secreted protein; ss

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides purified and isolated human 7-transmembrane receptor lectomedin polypeptide or its fragments. The lectomedin polypeptide comparises extracellular lectin-binding, olfactomedin-like and mucin-like domains. The polypeptide can be produced by standard recombinant methodology. The polypeptide is involved in callular adhesion and cytoplasmic metabolic pathways that are modulated by extracellular signaling. Specific binding to lectomedin-l expressed on smooth muscle cells may be required for proliferation of these cells in atherosclerosis. The polypeptide is used to raise specific antibodies, and to identify specific binding agents that modulate (increase or decrease) its activity. The lectomedin nucleic acids are used as source of probes and primers, and of therapeutic antisense, ribozyme or triplex-comming agents, and in gene therapy to restore deficient lectomedin activity. Specific binding agents of lectomedin are are used for treating diseases that involve lectomedin activity, e.g. vascular diseases such as atherosclerosis. The present sequence represents the DNA encoding the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                Since the promoter region of the nifH operon has been isolated, characterised and cloned, it is possible to delete the nifH and nifHD nitrogenase genes and replace them with structural genes isolated from an extraneous source. The extraneous genes thus placed under the control of the nifH promoter can then be inserted into a plasmid vector followed by conjugation into a fast-growing R.
                                                                                                                                                                                                                                                                                          promoter of fast-growing Rhizobium japonicum - used to drive

                                                                                                                                                                                                                                                                                                       This cDNA encodes a Xenopus protein "chordin". The functional recombinant protein chordin has a defined sequence of 941 amino acids and can induce dorsal and neural development and endodermal differentiation in vertebrates. The presence of a hydrophobic signal sequence, four possible N-glycosylation sites and conserved Cys-rich repeat regions suggest that chordin is a secreted protein. The DNA sequence can be operatively linked with an expression vector, to form a construct and a transformant can be obtained by introducing the construct into a host. Chordin may be useful as a component of culture media for culturing cells such as nerve or muscle cells, for treating neurodegenerative diseases and damaged nerve

The present expanded cDNA sequence encodes human BAG-5 (Bcl-2 associated athanogene-5) protein. BAG is a Hsc70/Hsp70-regulating protein protein the protein bloactivity, degradation, complex assembly/disassembly and translocation across membranes). It competes with Hip for binding to the Hsc70/Hsp70 APPase binding domain and promotes substrate release. Gene transfection studies indicate that BAG proteins influence a wide variety of cellular phenotypes through their interactions with Hsc70/Hsp70, proliferation, enhancing tumour cto apoptosis, promoting cell proliferation, enhancing tumour cell migration and metastasis and altering transcriptional activity of steroid hormones. BAG also stimulates Hsc70-mediated adenosine triphosphate (AFP) hydrolysis by
proliferation, cell migration and metastasis and steroid hormone
